

SUITESOLUTIONS: CSV INTEGRATOR

Accelerate Your NetSuite Implementation

We understand that companies often are required to integrate data from various external systems into NetSuite. While a few transactions can be handled manually, recurring transactions on an ongoing basis can easily consume hours of staff time. What if there was a way to increase efficiency by automating the manual process and configuring the steps and data needed for import?

There is.

Key Features

- Single tool for importing CSV file data.
- Configuration-driven framework to allow for mapping of CSV data records.
- Batch integration for periodic import of data.
- Download using FTP or SFTP.
- Supports character encoding within CSV import mapping.
- Supports both email-based and token-based authentication.

The SuiteSolutions – CSV Integrator can be implemented for transactions, items, customers or any custom records. This solution supports a configuration-driven integration framework that allows external applications to integrate with NetSuite using the core CSV import feature. This also allows multiple record types to be imported without requiring a separate integration solution. Any records that can be imported via NetSuite’s CSV import functionality can be integrated using this solution.

How It Works

SuiteSolutions – CSV Integrator provides an automated integration process for uploading/importing CSV files originating from external applications into the NetSuite Service.

In addition to the highlighted key features, this SuiteSolution includes an integration broker that can import multiple files into the NetSuite Service, process files that have more than 25,000 rows and can be configured to use multiple queues when SuiteCloud+ licenses are available.
